Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          83;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila melanogaster (fruit fly)

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 1997-526447/48. N-PSDB; AAT93294.

Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic

Example 3.3; Page 57-58; 132pp; English.

This protein comprises the wild-type AC1 protein of tomato mottle virus (ToMoV), a geminivirus that has a bipartite genome. The AC1 gene (see AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B. The AC1 protein has a DNA binding site specific to the DNA-A common region, a DNA nicking activity, and an NTP binding activity. The invention involves production of transgenic plants containing DNA comprising AC1 or C1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The

Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic
                                                                                                                                                        Example 3.5; Page 64-65; 132pp; English.
```

This protein comprises a transdominant lethal mutant, designated ToMoV-ACIDIMI, of tomato mottle virus (TOMOV) ACI protein (see AAM34336). It is encoded by a mutant ACI gene (see AAM33333) of tomato mottle virus virus (TOMOV), and carries a mutation in an NTP-binding domain. The ACI gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite TOMOV genome. The invention involves production of transgenic plants containing DNA comprising geminivirus ACI or Cl wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during the infection. Such transgenic plants are resistant to viral infection. The ACI genes are especially from TOMOV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or NTP-binding domains

It is encoded by a mutant ACI gene (see AAT93284) of tomato mottle virus virus (TOMOV), and carries 2 mutations in an NTP-binding domain. The ACI gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite TOMOV genome. The invention involves production of transgenic plants containing DNA comprising geninivirus ACI or C1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACI/C1 genes are especially from TOMOV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 361

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This protein comprises a transdominant lethal mutant, designated ToMoV-ACIdIm, of tomato mottle virus (ToMoV) ACI protein (see AAM34336). It is encoded by a mutant ACI gene (see AAT33282) of tomato mottle virus virus (ToMoV), and carries 3 mutations in its NTP-binding domains. The ACI gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite ToMoV genome. The invention involves production of transgenic plants containing DNA comprising geminivirus ACI or CI wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACI/CI genes are especially from ToMoV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAM34324-35) that have mutations in the highly conserved DNA-nicking and/or NTP-binding domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 361 AA;

                                                                                                                                                                                           This protein comprises a control mutant of the bean golden mosaic virus (BGMV) (1 protein (see AAW34338) that is required for replication. It is encoded by mutated C1 open reading frame BGAC190 (see AAT93290). The invention involves production of transgenic plants containing DNA comprising geminivirus C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains. (Updated on 17-OCT-2003 to standardise C
                                                                                                                                                                      and/or the field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato motile virus, tomato yellow leaf curl virus or bean golden mosaic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic
                                                            This sequence comprises the bean golden mosaic virus (BGMV) C1 protein that is required for replication. The invention involves production of transgenic plants containing DNA comprising C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypoptides (see AAM9324-55) that have mutations in the highly conserved DNA-nicking domain and/or the NTP-binding domains. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (SEMI-)

Sequence 353

Ą,

This protein comprises a transdominant lethal mutant of the bean golden mosaic virus (BGMV) Cl protein (see AAW34338) that is required for replication. It is encoded by mutated Cl pen reading frame BGAC221 (see AAT93291) and carries a mutation in the NTP-binding domain. The invention involves production of transgenic plants containing DNA comprising

Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypeptides (see AAW34234-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains. (Updated on 17-OCT-2003 to standardise OS field)
 Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein comprises a transdominant lethal mutant of the bean golden mosaic virus (BGMV) Cl protein (see AAM34338) that is required for replication. It is encoded by mutated Cl open reading frame BGAC28 (see AAT93292) and carries a mutation in the NTP-binding domain. The invention involves production of transgenic plants containing DNA comprising geminivirus Cl or ACl wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACl/Cl genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypoptides (see AAM34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains. It is encoded by mutated C1 open reading frame BGAC262 (see AAT93292) and carries a mutation in the NTP-binding domain. The invention involves production of transgenic plants containing DNA comprising geminivirus C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypeptides (see AAM34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a geminivirus replication (Rep) protein, which is also known as ALI. ALI binds double-stranded DNA, catalyses cleavage and ligation of single-stranded DNA, and interacts with other viral and host proteins. Mutants of the ALI protein are used to produce transgenic plants. The mutantion in ALI is present in a ribosome binding region, and expression of mutant ALI protein imparts increased resistance to geminivirus infection in the plant. Mutant ALI proteins are useful for producing plants having increased resistance or reduced sensitivity to a geminivirus such as tomato golden mosaic virus, tomato mottle virus, comato yellow mosaic virus, ladian cassava mosaic virus, potato yellow mosaic virus, bean golden mosaic virus, bean dwarf mosaic virus, squash leaf curl virus, Texas pepper virus, cotton leaf curl virus or beet curly top virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transgenic plants with increased resistance to geminivirus infection comprise a nucleic acid construct containing a nucleic acid sequence encoding a mutant ALI protein with a mutation in the Rb binding regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 356 AA;

The mutated viral nucleic acid is used for producing transgenic plants that are resistant to, or tolerant of, the native virus. The present sequence is a mutant form of the Rep (or C1) protein from the Sardinian isolate of tomato yellow leaf curl virus (STYLCV) in which the wild-type Lys227 residue has been changed to an Arg residue; transgenic Nicotiana benthamiana plants generated by transformation with the mutated virus were not resistant to STYLCV. In contrast, plants transformed with a virus in which Lys227 had been replaced by Ala were found to be resistant. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modification; mutation; viral replication; deficient; inhibition; viral resistance; geminivirus; tomato yellow leaf curl virus; Sardinian isolate; STYLCV; transgenic plant; P-loop; Cl protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                        Mutation of consensus amino acids in the NTP-binding site of geminivirus Rep protein is used to produce replication deficient viruses. The mutated viral nucleic acid is used for producing transgenic plants that are resistant to, or tolerant of, the native virus. The present sequence is a mutant form of the Rep (or Cl) protein from the Sardinian isolate of tomato yellow leaf curl virus (STYLCV) in which the wild-type Lys227 residue has been changed to a His residue; transgenic Nicotiana benthamiana plants generated by transformation with the mutated virus were not resistant to STYLCV. In contrast, plants transformed with a virus in which Lys227 had been replaced by Ala were found to be resistant. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleotide triphosphate binding site; DNA helicase; RNA helicase; modification; mutation; viral replication; deficient; inhibition; viral resistance; geminivirus; tomato yellow leaf curl virus; viral isolate; STYLCV; transgenic plant; P-loop; Cl protein;

The mutated viral nucleic acid is used for producing transgenic plants that are resistant to, or tolerant of, the native virus. The present sequence is a mutant form of the Rep (or C1) protein from the Sardinian isolate of tomato yellow leaf curl virus (STYLCV) in which the wild-type Lys227 tresidue has been changed to an Ala residue; transgenic Nicotiana benthamiana plants generated by transformation with the mutated virus were found to be resistant to STYLCV, i.e. the mutation results in a dominant negative phenotype. The C1 protein is required for replication. The invention involves production of transgenic plants containing DNA comprising geminivirus AC1 or C1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from TYLCV, tomato mottle virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that can have mutations in the highly conserved DNA-nicking domain and/or the NTP-binding domain.
